Starter Kit Guide

The starter kit can be downloaded from here:
https://drive.google.com/file/d/19c_rc3j3PfmETspFpFHRqCWBmrKsIa1R/view?usp=sharing

To run it, you need to do the following:
1. Download and install Node.js. (Link)
2. Make sure the node is installed by typing "node --version" in your terminal/cmd. You should see something get back the version (e.g. "v9.11.1")
3. Extract the starter kit into directory of your choice
4. Navigate to that directory using terminal/cmd. Hint: use "pwd" to make sure you're indeed there.
5. Once there, run the "npm install" command from the terminal/cmd
6. Now simply run the "npm start" and you should get back the following:
    a. "Project is running at http://localhost:5000"
7. Simply navigate to http://localhost:5000"

The project contains several folders:
- controllers/
    - Holds a simple controller that renders the home.pug template when visiting the root path. No need to touch this.
- node_modules/
    - Dependencies are installed over here. No need to touch this.
- public/
    - css/
    - img/
    - js/
    - The usual public files are over here.
- views/
    - This folder contains the .pug files.

You will just need to work with the public/ and views/ folders.

Views consists of a layout.pug file that described the general layout and individual pages such as home.pug.
